How California Would Be Affected by the Lieberman–Warner Climate Change Legislation

William W. Beach, Ben Lieberman, David Kreutzer, Ph.D., and Nicolas D. Loris

Workers and families in the state of California may be wondering how climate change legislation before Congress would affect their income, their jobs, and the cost of energy. Members of Congress are considering a number of bills designed to address climate change. Chief among them is S. 2191, America's Climate Security Act of 2007, introduced by Senators Joseph Lieberman (I–CT) and John Warner (R–VA).¹

The Lieberman–Warner legislation promises extraordinary perils for the American economy, should it become law, all for very little change in global temperature—perhaps even smaller than the .07 of a degree Celsius drop in temperature that many scientists expected from worldwide compliance with the Kyoto climate change accords. S. 2191 imposes strict upper limits on the emission of six greenhouse gases with the primary emphasis on carbon dioxide (CO₂). The mechanism for capping these emissions requires emitters to acquire federally created permits (called allowances) for each ton emitted.

Arbitrary restrictions predicated on multiple untested and undeveloped technologies will lead to severe restrictions on energy use and large increases in energy costs. In addition to the direct impact on consumers' budgets, these higher energy costs would spread through the economy, injecting unnecessary inefficiencies at virtually every stage of production and consumption.

Implementing S. 2191 would be costly in California, even given the most generous assumptions. Notable costs are listed in Table 1.

Estimated Economic Impact of S. 2191 in California

Year	Gross State Product Loss (\$millions)	Non-Farm Employment Loss	Manufacturing Jobs Lost	Personal Income Lost (\$millions)
2012	4,558.45	-15,341	-1,423	-2,685.31
2020	-9,274.54	-6,372	-52,947	-5,262.04
2025	-16,906.99	-62,795	-127,800	-13,057.79
2030	-14,594.92	-40,627	-214,834	-16,470.36

Table 1 • WM 1930-CA heritage.org

Consumers would be hard hit. Table 2 shows the expected increases in retail energy prices (adjusted to 2006 dollars to eliminate the impact of inflation) in 2025 for California. Between 2012, when the restrictions first apply, and 2025, the prices of electricity, natural gas, and gasoline could rise by nearly 20 percent nationally when compared to prices in a world without S. 2191.

Changes in Household Energy Prices in California Due to S. 2191

	Current Cost	2025 with Current Law in Place	2025 with Lieberman–Warner in Place	Dollar Difference
Electricity	\$1,014.67	\$1,444	\$1,787	\$343
Natural Gas	\$561.32	\$791	\$876	\$86
Gasoline	\$1,648	\$1,625	\$1,953	\$328

Note: The current annual cost of natural gas is based on consumption and prices as of 2006, the most recent data available. The annual cost of gasoline is based on the average price of regular unleaded in each state on May 20, 2008.

Table 2 • WM 1930-CA  heritage.org

In addition to taking a bite out of consumers' pocketbooks, the high energy prices throw a monkey wrench into the production side of the economy. Contrary to the claims of an economic boost from “green” investment and “green-collar” job creation, S. 2191 reduces economic growth, gross domestic product (GDP), and employment.
